W14 Final Website report

Daybreak Mexican Tamales webpage

My wife has a side little business at home. She prepares and sales Mexican tamales in our neighborhood. She started about 12 years ago and she accredited the business really well during all these years. She sales only during holidays, special days and the community knows her and waits for those days to order.

The holidays last year we had more orders than ever before, and it was hard to coordinate the orders, preparing and organizing the delivery. During the quarantine people contacted us looking for something different to eat. We prepared and sold the tamales a few weekends for extra income but also to give something back to the stressed community and friends around us. When I noticed that I needed to create a page for the class, I immediately decided to start the page for our business. Our audience is our neighborhood, friends and people close by and the page will be a platform to place orders and answer basic questions.

We take orders through Facebook messenger and people pay using Venmo or bringing cash. The goal is to promote our business and improve our system to sell more and been more organized for us. We will save time and reduce human mistakes when people order online and pay using our virtual store. With the page working we need to worry only in the production and the delivery.

The page is: <https://succulent-sepia-watchmaker.glitch.me/index.html>

Learning about CSS was a challenging but a fun experience. I am not orientated to use colors or designing, and I learned a lot about it during the class and creating the page. I had to change colors that combined better. The wireframing was relatively easy but portray the idea to coding it was a different story.

It was particularly challenging to find coding errors. I spent most of the time looking and correcting typing errors or omissions that caused everything to fail or not looking in the way I wanted.

In conclusion, I learned a lot about coding, CSS and how combine everything but more specifically, I learned to be more organized and use notes all the time because you easily can get lost of your work and the price is high. You can spend a lot of time fixing little details and even worst getting lost and it makes you feel that everything that you have done is not working.

Suddenly, you find yourself correcting things that are fine and creating more problems to your work.

Planning is essential in a project like this one or even for bigger projects. I learned how important the wireframes are. Following the wireframes is like the map for the hidden treasure and they save the work when you are getting lost. I am excited to see what is coming in the following classes.
